KuralCredit

Helping small businesses explain their finances in their own words.

KuralCredit is a voice-first assistant that helps small businesses share the context behind a loan application, clarify gaps in their information, and prepare a clearer set of records for a person to review.

Why this matters

For many small businesses, explaining how the business works is easier than filling out a formal application. Sales may be discussed in a local language, while supporting details sit across bank statements, GST records, and sales registers. When the numbers do not line up at first glance, the difference may need an explanation - not an assumption.

A form can collect figures. It cannot always capture the story behind them. That is the gap KuralCredit is built to address.

How KuralCredit works

1. **The applicant speaks.** They explain their business and figures in a supported language, using a familiar voice interface.
2. **The words are checked.** Gnani speech recognition turns the recording into text. The applicant can review and correct it before the system uses it.
3. **Useful details are organised.** Groq-powered reasoning identifies candidate facts and places them into the fields required by the workflow.
4. **The numbers are checked carefully.** Deterministic Python rules and decimal arithmetic normalize amounts and compare relevant records. The language model is not trusted to do financial arithmetic.
5. **Unclear points are clarified.** KuralCredit asks neutral follow-up questions and can read them aloud using Gnani text-to-speech.
6. **A person reviews the evidence.** The system brings together declarations, document details, differences, and their sources in one reviewable record.

What makes the approach useful

- **A conversation before a long form:** applicants can explain things naturally and correct the transcript.
- **Checks that can be followed:** financial comparisons use explicit rules, and source information remains distinguishable from extracted or calculated values.
- **Questions instead of assumptions:** a difference between bank credits and declared sales is a reason to ask for context, not to label the applicant.
- **A clear hand-off:** reviewers get the information and its sources; they remain responsible for the decision.

What is built today

The main workflow supports MSME loan-application clarification using spoken declarations and financial records. A customer-support intake workflow also runs through the shared conversation pipeline, demonstrating that the same approach can serve a second type of intake. The application uses React and TypeScript, FastAPI, Gnani Prisma speech-to-text, Gnani Timbre text-to-speech, and Groq-hosted `openai/gpt-oss-120b` for structured reasoning. An explicit mock mode is available for offline testing; live provider connectivity should be verified in the environment used for a demonstration.

A clear boundary

KuralCredit does not lend money, calculate a credit score, detect fraud, or approve or reject applications. It does not assume that every bank credit is revenue, and it does not fill in missing figures as facts. It helps organise information and ask better questions. Any lending decision stays with an authorised human reviewer.

The aim is simple: make it easier for a small business to be understood, and easier for a reviewer to see what still needs explaining.
